

Managed Security Services Partner Liaison Request (Actual Example)

Project Scope:

Proactive 24 hours a day, 365 days a year managed security monitoring and response. Ideally the managed security provider should:

- Take prompt mitigating preventative action on our behalf to block and contain the threat, minimizing any wider impact and risk
- Promptly alert relevant IT Staff to type, scale and scope of threat and provide details of initial response
- Provide recommendations for further investigation and remediation
- Subsequent confirmation that threat has been fully eradicated
- Implement and host an industry recognized SIEM
- Comparative analysis of internal events with wider external threat intelligence

Additional Requirements:

Penetration testing

Infrastructure vulnerability scanning/assessment

Virtual CISO

Security configuration assessment and recommendation.

This relates to any security sensitive devices

For example, review of configuration/rules in firewalls, web proxy/security solutions

Privileged account management

We are looking for recommendations and tools to ensure any “admin” or “root” type access is effectively managed and tracked to minimise risks

Multi-Factor Authentication

To meet our contractual and regulatory obligations, we need to implement a multi-factor authentication solution. The costs of the solution may fall outside the boundary of the managed security solution, but we will be looking for guidance, advice and recommendation

Legacy device protection

We have several legacy devices that simply cannot be upgraded to modern operating systems or have third party security solutions installed. We are looking for guidance and advice as to how we can effectively ring-fence such devices on the data network and provide some form of in-line security protection.
